SUMMARY

Data Science enthusiast and AI undergraduate with hands-on experience in ETL pipelines, exploratory data analysis, machine learning, and GenAI workflows. Proficient in Python, SQL, and visualization tools including Tableau and Matplotlib. Experienced in building end-to-end data projects — from raw data ingestion and preprocessing to dashboarding and ML-based predictions — with a strong product and analytical mindset.

TECHNICAL SKILLS

- **Languages:** Python, SQL, JavaScript
- **Libraries:** Pandas, NumPy, Matplotlib, Seaborn, scikit-learn, LangChain
- **Visualization:** Tableau, Matplotlib, Seaborn
- **Tools:** Jupyter Notebook, Git & GitHub, Streamlit, Excel
- **Other:** ETL, EDA, Data Cleaning, Feature Engineering, Machine Learning, GenAI, RAG, LLM, Statistics

PROJECTS

Blinkit Sales, Delivery & Customer Analytics – GitHub

Tools: Python, Pandas, NumPy, Tableau, Excel • Role: ETL & Analysis

- Designed and implemented a complete ETL pipeline on raw Blinkit operational data spanning sales, delivery operations, and customer behavior across 68,000+ records.
- Performed feature engineering and in-depth EDA to surface revenue seasonality trends, peak-hour delivery bottlenecks, and customer satisfaction patterns.
- Built an interactive Tableau dashboard across 3 analytical sections — Business Overview, Delivery Efficiency, and Customer Insights — enabling data-driven decision-making.
- Identified critical business issues: ~62% of orders delayed, ~63% negative customer feedback, and low average satisfaction rating (~3.3); delivered targeted operational recommendations.

DVA Capstone – Data Visualization & Analysis (Collaborative) – GitHub

Tools: Python, Pandas, NumPy, Matplotlib, Jupyter Notebook • Role: Data Preprocessing, Cleaning & Analysis (Collab)

- Collaborated in a team on an end-to-end data analytics project, owning the data preprocessing and cleaning pipeline to prepare raw datasets for downstream analysis.
- Handled missing value treatment, outlier detection, data type normalization, and feature-level transformations to ensure high-quality analytical inputs.
- Conducted exploratory data analysis (EDA) to identify trends, correlations, and anomalies, contributing key insights to the team's final visual storytelling and reporting.
- Coordinated with teammates on collaborative Jupyter workflows, maintaining clean version control via Git and aligning on analytical methodology throughout.

Solar Power Prediction – ML & GenAI Forecasting Pipeline – GitHub

Tools: Python, scikit-learn, LangChain, FAISS, Streamlit, Docker, Groq API • Role: Full Project

- Built a 2-milestone GenAI capstone: an ML forecasting pipeline + LangGraph agentic workflow for 15-minute ahead solar DC power prediction, deployed via Streamlit and Docker.
- Engineered 9 features (lag, rolling mean, time-based, weather) on 68,778 inverter-level records; RandomForestRegressor achieved R^2 of 0.9905 (daytime) and 0.9323 (full dataset).
- Implemented a 3-node agentic RAG system: forecast analysis → FAISS retrieval → structured LLM recommendations via Groq (Llama 3.1 8B) using LangChain and Sentence Transformers.

EDUCATION

Bachelor of Technology – Artificial Intelligence

Newton School of Technology, Rishihood University | 2024 – 2028

SGPA: 7.435 / 10.0

Intermediate (Class XII) 89.8%

Army Public School | 2022 – 2023

Matriculation (Class X) 93.0%

Army Public School | 2020 – 2021

AREAS OF INTEREST

Machine Learning & Predictive Modelling • Data Engineering & ETL Pipeline Design • Generative AI & Agentic LLM Workflows • Business Intelligence & Data Storytelling • NLP & RAG
